

A B S T R A C T

The invention relates to a sectional door. According to the
5 invention, the sectional door comprises at least one first
section and one second section (16, 78), whereby in the
closed state, the sections of the sectional door are
arranged on top of each other essentially on one plane in
order to improve said sectional door and especially in
10 order to provide rapid and safe operation of the sections
(16, 78) of said sectional door, and whereby the sections
(16, 78) are guided on at least one side edge by means of a
section guiding device (12) such that the sections (16, 78)
interact with each other without connecting means being
15 arranged therebetween.
